

GIGALA

Engineering Design by
Artificial Intelligence

The background of the slide features a large, abstract geometric design. A thick, jagged black line runs diagonally from the bottom left towards the top right. Overlaid on this is a thin white line that follows a similar path but with more frequent, sharper turns, resembling a circuit board trace. Three circular nodes are placed along this white line: one at the bottom left, one in the middle, and one at the top right. The bottom-left node is surrounded by a dotted white circle, while the other two are solid white circles.

Georgy Tskhondiya

Hello. I am Georgy, ex subsea pipeline installation engineer, data science professional & founder at Gigala. We combine structural engineering and artificial intelligence to optimize designs of mechanical and electrical components.

Our mission

- Solve creativity to advance science and engineering
- Make AI accessible

AI and engineering design bring great

new features

to offshore construction
and topology optimization

Our expertise

OFFSHORE DYNAMICS

- Subsea pipelines installation
- Lifting operation
- Offshore floating wind farms
- ROV/UUV control
- Dynamic positioning with AI

TOPOLOGY OPTIMIZATION

- Mechanical structures
- Electrical circuits
- MEMS
- Computer chips

OFFSHORE DYNAMICS

Pipeline dynamic simulation

Bending, stress and strains during the offshore procedure. Design criteria in accord with DNV-OS-F101 standard.

Lifting operation automation

Lifting stability in accord with DNV-ST-H205 standard.

Vessel motion

As input to offshore dynamics simulation.

Offshore floating wind farms

Efficacy of the technology.

Subsea pipeline installation **EXPERTISE**

Certificate

Installation calculation for
subsea pipelines

Methodology

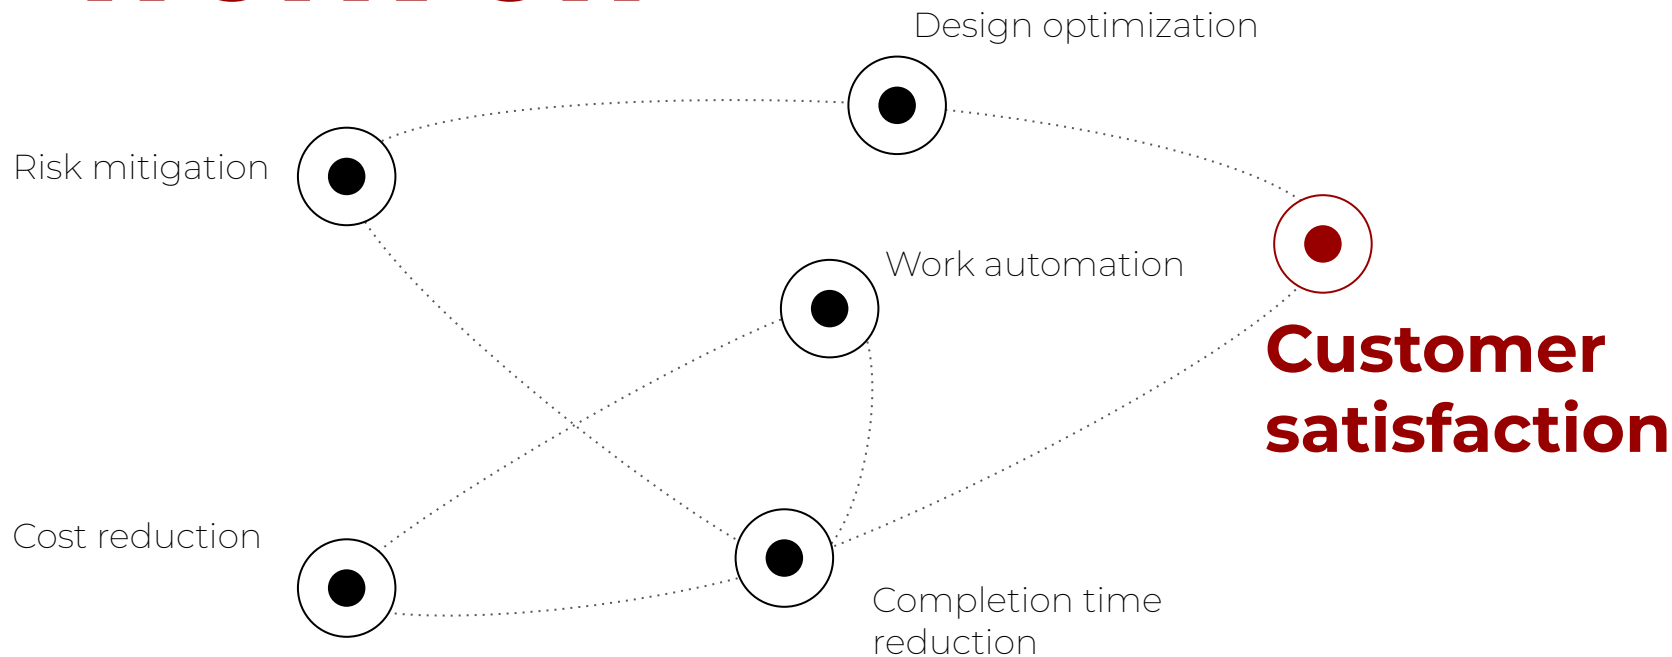

Subsea pipelines
installation analysis

Software

For modelling offshore
dynamics during construction
phase

in each project we work on

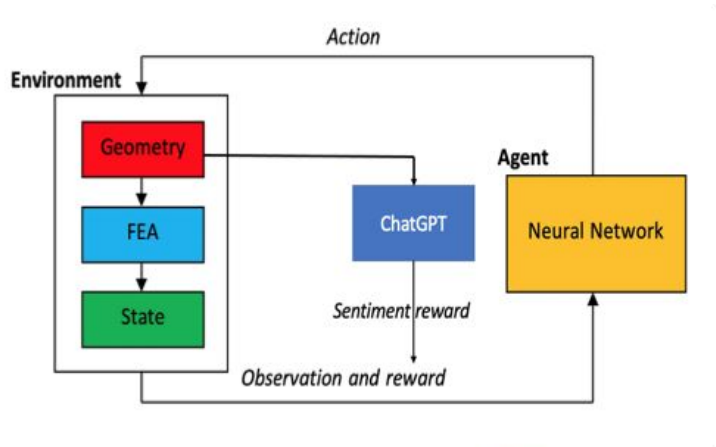

OFFSHORE DYNAMICS demo

Engineering design automation can be formulated as Markov decision process (MDP). where an engineer provides initial geometry of a structure, sets loads and allowed actions to alter the geometry, specifies the optimization objective (e.g. minimize weight, maximize stiffness), and starts training the model. After the training, in inference stage, the engineer gets her final design. This process can be augmented by recent developments in Generative AI.

TOPOLOGY OPTIMIZATION

- Mechanical structures
- Electrical circuits
- MEMS
- Computer chips

Spools

Bionic partition

MEMS & Chips

Software
for topology optimization and sizing

7 STEPS

to the service we can be proud of

1 Your application

2 Scope or work, NDA, PoC, IP

3 Cost estimation

4 Contract and schedule of work

5 Development, testing

6 Integration

7 Win&win partnership

Pipeline dynamics: J-lay, S-lay

Risers, moorings, pipelines

Pipeline automation

Hardware-in-the-loop (HIL) testing for vessel control systems

Lifting operation

What we do and work with

Offshore floating wind farms dynamics

ROV/UUV control

Vessel motion

Topology optimization

Pipeline profile optimization

Pricing on development

PoC at the rate of 50\$/ hr
per engineer

Project tailoring cost to be
discussed individually

free

demo and sample code
testing

8 years

PhD MAI'12, and offshore
engineering

Experience

7 years

in data science
